

Light up a RGB

! Note:

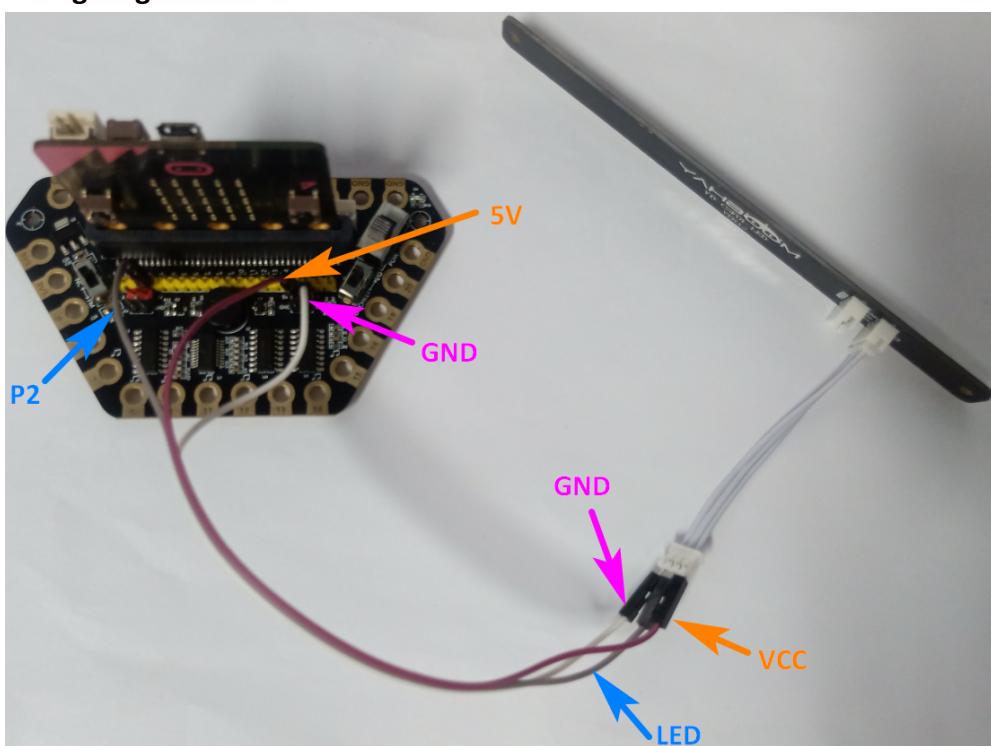

When performing this experiment, the current consumed is large.

We recommend plugging the USB data cable into the micro:bit expansion board to power supply the light bar and the micro:bit board. As shown below:

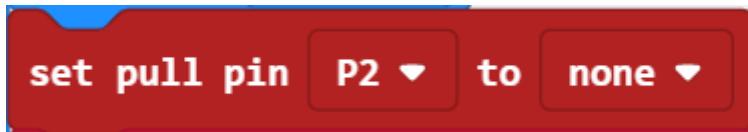

If the USB data is directly plugged into the micro:bit board for power supply, it will affect the effect, such as color saturation of RGB lamp is reduced.

The wiring diagram is as follows:

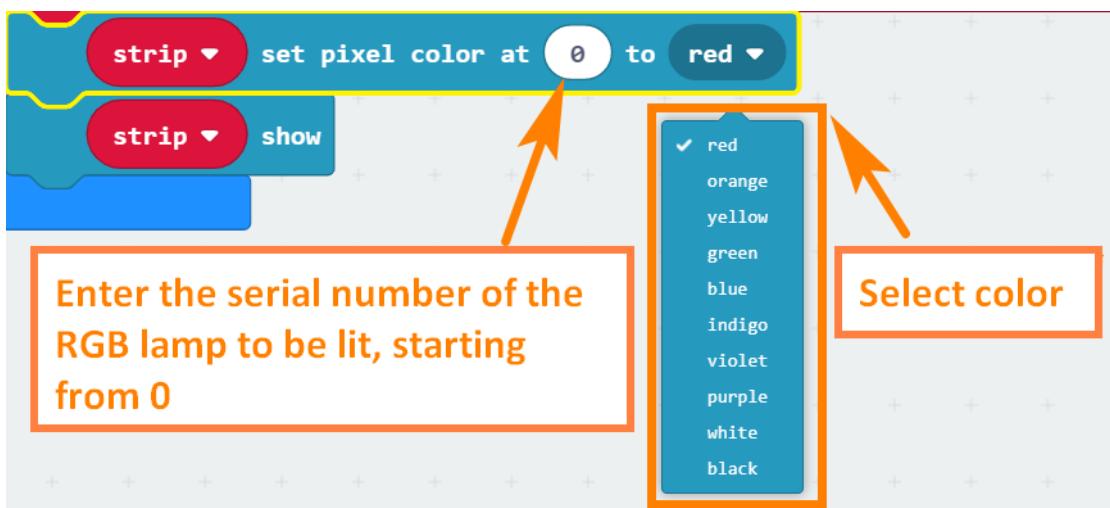

Program analysis:

It means that RGB bar connects to P2 of micro:bit.

There are a total of 5 RGB lights on the RGB bar. If you have cascaded other RGB bars, you can modify the quantity directly here.

Experimental phenomena:

After the program download is complete, we can see that the first RGB light on the RGB bar is lit red.
